ABSTRACT

A multiple-zone power control system for controlling electric heating
elements, including a power control unit having multiple control zones, a
touch-sensitive function key, and a touch-sensitive on/off key for activating and
deactivating one of the control zones. When all of the control zones are deactivated,
the touch-sensitive key must be touched for at least a cold start duration in order to
activate the designated control zone. Alternatively, the designated control zone is
prevented from being activated if the touch-sensitive function key is touched while the
touch-sensitive on/off key is being touched. The control system also includes two
power controllers connected by a communication bus. When one of the power
controllers initiates a lockout condition, the other power controller initiates a
corresponding lockout condition. Multiple heating elements can be controlled
together using a single set of control keys. A element size key toggles between
different combinations of heating elements to control.
